EDUCATION

Bachelor of Computer Science, University of Maryland, Baltimore County Expected May 2026

Relevant Coursework: Artificial Intelligence, Machine Learning, Operating Systems, Software Engineering, Computer Architecture, Computer Networks, Cybersecurity, Quantum Computing

SKILLS

- **Artificial Intelligence:** Copilot M365, Copilot for Github, AI-Assisted Development, AI Agent Design, Prompt Engineering, Context Management and Validation
- **Coding Languages:** Python, C++, C, x86 Assembly, MATLAB
- **Software:** Microsoft Office Suite, iManage, Litera, SharePoint, Git, GitHub, Legal Technology
- **Others:** Technical Communication, Technical Writing, Research, Software development

EXPERIENCE

IT Service Desk Analyst, DLA Piper (via TekSystems)

May 2025 - Present

- Built a Copilot Agent capable of ingesting existing HTML and legacy articles, automatically reformatting them to the documentation standards I helped define for the global IT knowledge base.
- Provided advanced application support for iManage, Litera, SharePoint, and other firm-wide legal applications used by attorneys and business professionals.
- Guided knowledge article team members on effective Copilot agent usage and prompt construction by demonstrating recommended workflows for an agent endorsed by management.
- Led onboarding and training for new analysts, improving team readiness through structured walkthroughs of firm systems, workflows, and documentation standards.

Keyholder, Sales Associate, ZAAF (BWI Airport)

Jan 2024 – May 2025

- Operated efficiently in a high-security environment, demonstrating thorough knowledge of regulations
- Maintained up to date security training for secure areas beyond airport security
- Designed and implemented an Excel-based timesheet and payroll system; trained staff on system usage, resulting in full adoption across the location

PROJECTS

Connect Four Linux Kernel Module (C)(Webpage)

- Developed a Linux kernel module enabling terminal based Connect Four gameplay via a custom device file
- Implemented user interaction through standard Linux I/O commands (e.g., echo, cat), simulating application-level input/output workflows
- Designed a user-space interface to simplify interaction and display game state clearly
- Created a kernel-space AI agent to simulate intelligent opponent moves

Dominoes Game and AI Agent (Python) (Webpage)

- Developed a fully functional dominoes application featuring multiple custom AI agents with distinct strategies
- Built Excel export and reporting tools to analyze agent performance and compare results across millions of simulated games
- Designed and implemented a genetic-algorithm–based training framework, improving overall agent win rates by 6%
- Optimized application logic and rendering pipelines to increase simulation throughput to 3,300 games per second
- Produced a top-performing agent achieving a 57% win rate against a random baseline opponent
